

BUSINESS REQUIREMENTS DRAFT

Comment Correction Capability

Controlled input for refinement — not an approved implementation specification

DRAFT — FOR REVIEW

Document ID	BRD-COM-017	Version	1.2
Owner	Product Management	Status	Draft for review

1. Purpose

Registered users should be able to correct obvious mistakes in comments shortly after publication. The objective is to reduce unnecessary delete-and-recreate actions while preserving trust in article discussions.

2. Background

Customer Support has received reports from users who noticed spelling or formatting mistakes immediately after posting a comment. At present, the user must delete the comment and create a replacement.

The first release is expected to focus on correction rather than moderation or content-revision management.

3. Business scope

Area	Draft expectation	Status
Eligible user	The author of the comment	Proposed
Correction period	Shortly after publication	Requires decision
Corrected text	Replaces the visible comment text	Proposed
Modification information	The system should retain the time of the latest modification	Proposed
Revision history	Not required for the initial release	Working assumption
Administrative correction	Considered a future possibility	Not in current scope
User interface	A client may expose the capability	Not specified for this backend item

4. Behavioral notes

1. A correction must not create a second comment.
2. A user must not correct another user's comment.
3. Existing comment creation, listing and deletion must continue to work.
4. Invalid correction attempts must not partially change the stored comment.
5. The capability should remain compatible with existing clients that do not use it.

5. Open questions

- What exact duration qualifies as “shortly after publication”?¹
- Is the boundary inclusive or exclusive?
- Is a correction window measured from original publication or from the latest modification?
- Should corrected comments be visibly marked as edited?
- Which error categories should be exposed by the API?
- Is a revision history required in a later release?

6. Non-functional considerations

- Authorization must be enforced by the backend.
- Raw comment text should not be written to operational logs.
- The rule must be testable without tests waiting for real time to pass.
- The change should be small enough to review independently.

7. Approval state

This document is a draft input to refinement. Values marked as proposed or working assumption are not approved decisions.

End of controlled draft input

¹ An early discussion used **30 minutes** as a working assumption for estimation. Product has not approved this value. It must not be treated as a final requirement.
